BigPrint TV — how to shoot the video (head camera)

The whole film is what YOUR eyes see. Your face is never in it. No helper is needed. Total video: **2 minutes 43 seconds** (the limit is 3:00). Deadline: Thursday 23 October, 12 noon Pacific = Friday 24 October, midnight Pakistan time.

What you already have

The TV footage is done (folder **video/clips**). The eye animation is done (**scotoma_animation.mp4** on your Desktop). You printed the two bills: one sharp, one blurry. You film 5 short pieces, alone. About 1.5 hours. Each drawing shows what your camera should see.

Get ready (before filming)

1. Strap the camera to your head: a phone in a head strap, or any small camera. The lens sits just above your eyes and points where you look.

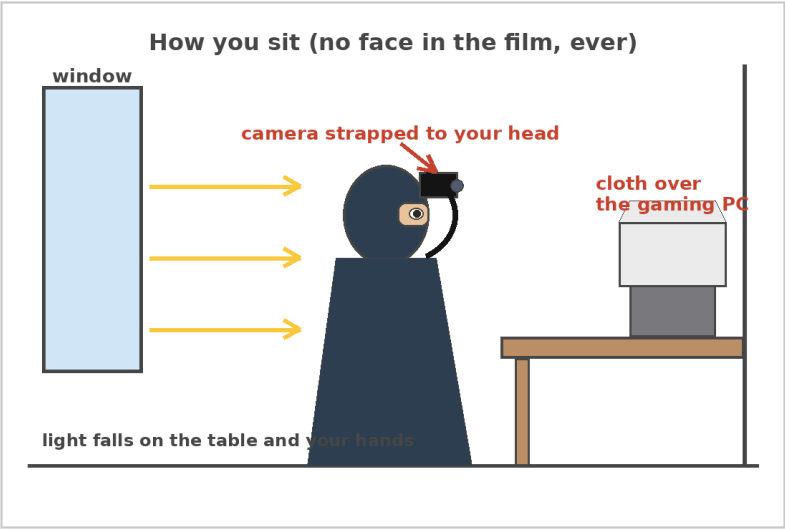

2. Test it: record 10 seconds while looking at your hands on the table. Play it back. Your hands should be in the middle of the picture. Move the strap until they are.

3. Put a cloth over the gaming PC. Its logo must not be in the film.

4. Tape over your name on the OCT scan papers. Fold the sharp printed bill in three, then open it.

5. Light must fall on the table and your hands. If your head makes a shadow on the paper, turn a little to the side and test again.

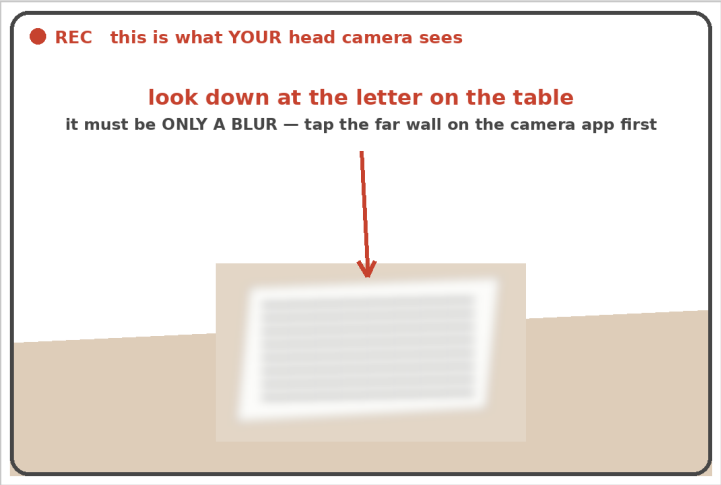

6. Move your head SLOWLY, always. Hold every look for 2 seconds. If the sound is bad on the test clip, record the spoken lines separately with the phone lying near you — voice and picture are joined in the edit.

Film these 5 pieces (record each one 3 times, keep the best)

Piece 1 — The letter you cannot read (5 seconds, no talking)

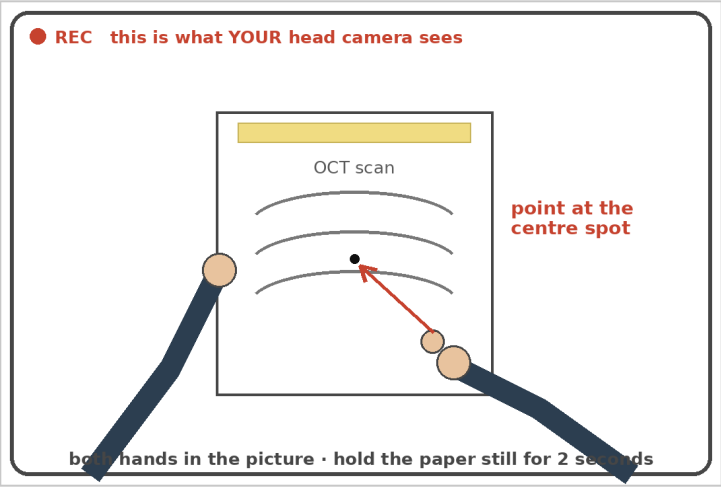

Sit at the table. Look down at the folded bill. In the camera app, tap the far wall first, so the paper is only a blur. Hold your head still for 5 seconds.

Piece 2 — Your hands with the scan (15 seconds)

Hold the taped scan in front of you with both hands. When you say “right in the centre”, point at the centre spot with one finger and keep it there for 2 seconds.

Say: "Hi, I am Rukhsar. A few months ago I hurt my eyes by looking at the sun. This is the scan of my eye. The damage is one small spot, right in the centre. And the centre is exactly where we read."

Piece 3 — The look up (17 seconds)

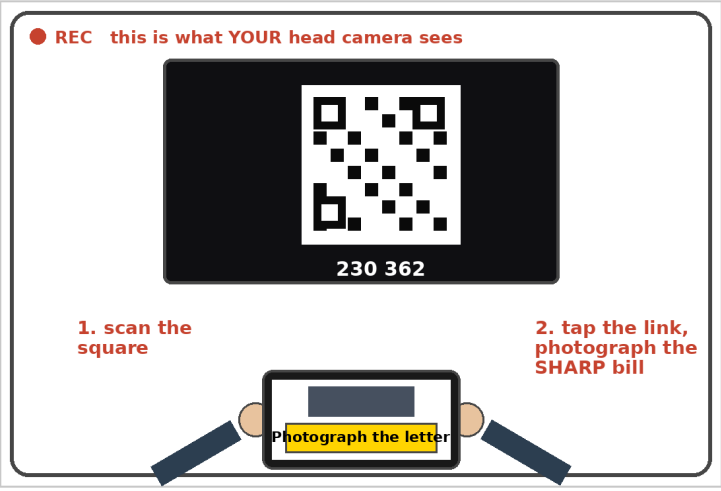

Start looking down at the letter in your hands. On “Then one evening I looked up”, raise your head SLOWLY until the TV fills the middle of the picture. This one movement is the best shot in the film. Do it 3 times, keep the smoothest.

Say: "For weeks I could not read my phone, and I could not read my letters. Then one evening I looked up. The biggest screen in my house was already in the room, and I knew how to use its remote. So I built BigPrint TV. Here is how it works."

Piece 4 — Scan and photograph (film it all, we use 16 seconds)

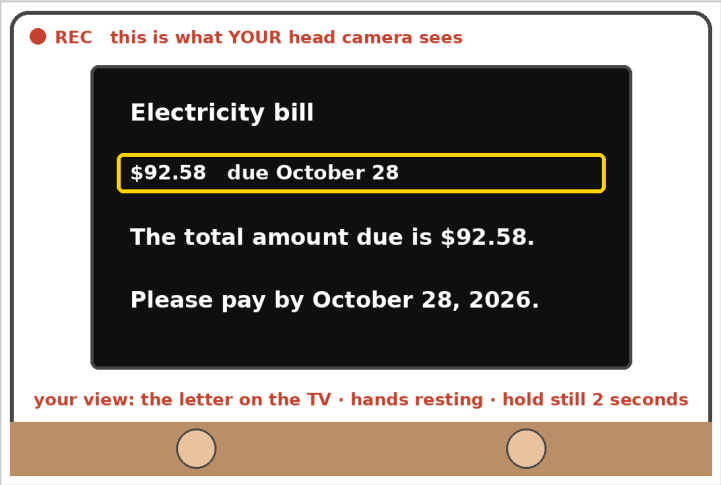

App on the TV (the simulator, full screen). Look at the TV and scan the QR square with your phone. Tap the link. Look down and photograph the SHARP printed bill. Look up and keep filming until the letter appears on the TV. While everything is set up, also send the BLURRY page once, so the TV shows the “Check” warning on your real paper. Keep the window title visible at least once.

Piece 5 — The ending (22 seconds)

Sit back. Look at the TV showing the letter in big print, hands resting on the table. Speak the lines, slow down at the end, then hold your head still for 2 seconds.

Say: "I built this for myself. But millions of people live with sight loss, most of them older, and their letters keep coming. It costs about three cents a letter, and it is open source. BigPrint TV. The television you already own, reading your mail."

The timeline (give this to the editor, or to Claude)

Time	What is on screen	Sound
0:00 - 0:03	Piece 1: the blurred letter, your view	The TV voice says the bill amount (from clip 05)
0:03 - 0:08	TV clip: the letter in big print	Same voice keeps talking
0:08 - 0:10	Black screen, white words: BigPrint TV	Silence
0:10 - 0:25	Piece 2: your hands with the scan	Your voice
0:25 - 0:31	The eye animation (6 s): the black dot eats the $92.58	You say: “The word I look at is the word I lose.”
0:31 - 0:48	Piece 3: the look up from the letter to the TV	Your voice
0:48 - 1:04	Piece 4: your hands scan the QR and photograph the bill	You say: “Anyone with a phone scans the code and photographs the letter. The phone is only a camera.”
1:04 - 1:26	TV clips 03 + 04: big print, figures on top, moving line by line	You say: “Ten seconds later the letter is on the TV. The amount, the date and the account number stay at the top. Every number comes from reading the page, never from an AI guess, and a second reader checks the money.”
1:26 - 1:42	TV clip 05: Listen, Pause, Keep listening	Let the TV voice be heard, then say: “Press Listen and the whole letter is read aloud, made only when you ask.”
1:42 - 2:00	TV clips 06 + 07 + 08: Main points, Exact words, bigger text, 3 colours	You say: “Three ways to read it. Text up to twice the size. And three looks, because eyes differ about what is easiest.”
2:00 - 2:11	TV clip 09: the blurry page and the warning panel	You say: “When a page is hard to read, it says so. A wrong number is worse than no number.”
2:11 - 2:21	TV clip 10: Next photo, Recent letters, Delete all	You say: “Next photo reads the next page. Letters stay one day, then everything is deleted.”
2:21 - 2:43	Piece 5: your view of the TV. In the last 5 seconds the repo address appears: github.com/rukhsarai/bigprint-tv	Your voice

How the timing was counted

A calm speaking pace is about 2.5 words per second. Every “Say” line was counted: piece 2 is 38 words = 15 s, piece 3 is 43 words = 17 s, piece 5 is 47 words with a slow ending = 22 s. The TV clips are already the length written. Total: 2:43, with 17 seconds of safety under the 3-minute rule.

After filming

1. **1.** Send all pieces to Claude, or edit yourself in CapCut. Follow the timeline table.
2. **2.** No music anywhere. No logos. Captions on (YouTube makes them, then fix the mistakes).
3. **3.** Upload to YouTube as Unlisted. Open the link in a private window to check it plays.
4. **4.** Paste the link in the Devpost form. The description text is ready in DEVPOST_SUBMISSION.pdf.
